New features in version 3.0.3

System

SNMP

A new OID (Object Identifier) ntqifDrvName corresponding to the system names of network interfaces has been added to the NETASQ-IF-MIB (Management Information Base) .

Directory configuration

The field that defines the name of an LDAP directory has been renamed "Domain name".

Version 3.0.3 bug fixes

System

Authentication

Support reference 58610

Migrating a configuration that uses the "Guest" authentication method together with the customized "e-mail" field would cause an error on the captive portal as this field was not converted properly. This anomaly has been fixed.

Support reference 58816

Attempting to upgrade a configuration with a customized firewall name (**Configuration** module) and the **Use firewall name or certificate CN as FQDN** option selected (**Captive portal – Advanced properties** tab in the **Users > Authentication** module in version 2) to version 3 of the firmware would make SPNEGO ineffective.

Directory configuration

Support reference 58512

When migrating configurations that reference external LDAP directories to version 3, such directories would adopt the object name of the LDAP server instead of the domain name. This anomaly, which made the SSO Agent method ineffective, has been resolved and the name of the directory is now made up of the root domain (base DN) declared during its creation.

Support reference 58883

Attempts to migrate to version 3 configurations that reference external LDAP directories with a root domain (DN) containing one or several uppercase letters would render such directories invalid. This issue has been fixed.

Support reference 58825

Filtering and NAT

The display would not refresh during switches from a local filter policy to a global filter policy bearing the same index.

Support reference 58475

SSL VPN portal

The latest versions of the Java client application could prevent connections to servers that can be contacted via the SSL VPN portal as they would reject certificate authorities signed with MD5. This issue has been fixed.

Support reference 58746

Access privileges

The selection of a user in the **Detailed access** tab in the **Access privileges** module would result in his/her identifier being replaced with his/her first and last names. This issue, which caused authentication to malfunction, has been fixed.

Intrusion prevention

Support reference 58572 58589 58742 58553

HTTP

An anomaly in the HTTP security inspection would cause the firewall to hang and the proxy to consume an excessive amount of CPU resources. This anomaly has been fixed.

Web administration interface

Directory configuration

Support reference 58871

Backup servers added to the advanced properties of external directories (Microsoft Active Directory, external LDAPs or PosixAccount LDAPs) would no longer appear after a user browses in the other modules of the web administration interface. This anomaly has been fixed.

Support references 58734 - 58704 - 58900

The web administration interface would not apply changes made to the selection filter of user groups in external directories (**Structure** tab in the directory). This anomaly has been fixed.

Monitoring - Reports - Audit logs

Support reference 58921

User monitoring

When several users were authenticated and connected, refreshing the user monitoring module using the Refresh button would cause the firewall to hang. This issue has been fixed.

Activity Reports

On firewall models that do not have log partitions (diskless models), once the 5 reports allowed were enabled, the corresponding data would not be displayed.

Compatibility

Lowest version required: Stormshield Network 2.x

Hardware compatibility:

SN150, SN200, SN300, SN500, SN510, SN700, SN710, SN900, SN910, SN2000, SN3000 and SN6000

SNi40

NETASQ U30S, U70S, U150S, U250S, U500S and U800S

Stormshield Network and NETASQ Virtual Appliances

Hypervisor compatibility:

VMWare ESX/ESXi: version 5.5 and upwards

Citrix Xen Server: version 6.2 and upwards

Microsoft Hyper-V: Windows Server 2012 and upwards

Linux KVM: Red Hat Enterprise Linux 7.2 and upwards

Lowest versions required for Stormshield Network client software:

SSO Agent: version 1.4 and upwards

SSL VPN Client: version 2.0 and upwards

Software compatibility for the installation of the administration suite (SN Real-Time Monitor and SN Global Administration):

Microsoft Windows 7, 8 and 10

Microsoft Windows Server 2008 and 2012

 NOTE

In order for the firewall administration interface to operate optimally, you are advised to use the latest versions of Microsoft Internet Explorer and Mozilla Firefox (LTS version - Long Term Support). For further information on these versions, please refer to the relevant vendors for the life cycles of their products.

Recommendations

Before you migrate an existing configuration to version 3 of the firmware, ensure that you have:

- read the section [Known issues](#) carefully,
- read the section [Explanations on usage](#) carefully.
- **performed a backup** of the main partition on the backup partition and performed a configuration backup

Extended Web Control

If synchronous mode has been enabled on the Extended Web Control URL filtering solution, it must be disabled before upgrading the firewall to v3. To do so, delete the line containing the parameter `X-CloudURL_Async` ([*Config*] section in the *ConfigFiles/proxy* configuration file).

Updating a cluster with several high availability links

For clusters that implement more than one link dedicated to high availability, ensure that the main link is active before proceeding to upgrade to version 3.

SSO agent authentication method

In a configuration using the "SSO Agent" authentication method, the SSO agent has to be migrated to version 1.4 before migrating the firewall's version.

BEFORE MIGRATING THE FIREWALL, you must also fill in the "Domain name" field in the SSO agent configuration. For the SSO agent to operate correctly, the domain name must correspond to the real name of the domain (e.g., stormshield.eu).

Policy-based routing

If the firewall has been reset to its factory settings (*defaultconfig*) after a migration from a 1.x version to a 2.x version then to a 3.x version, the order in which routing will be evaluated will be changed and policy-based routing [PBR] will take over priority (policy-based routing > static routing > dynamic routing >...> default route). However, if the firewall has not been reset, the order of evaluation stays the same as in version 1 (static routing > dynamic routing > policy-based routing [PBR] > routing by interface > routing by load balancing > default route).

Filter policies and users

In previous versions of the firmware, the filter policy did not distinguish between users and groups. In version 3, support for multiple directories requires strict checks on users. Migrating a configuration to version 3 of the firmware may therefore generate warnings asking the administrator to re-enter users in the filter policy in order to avoid any ambiguity.

Known issues

Intrusion prevention

REGISTER SIP requests that contain asterisks in the Contact field in their headers are not supported. They will generate a block alarm *"The SIP request contains an invalid URI (Contact field)"*.

System

Support reference 58515 58520 58594 58634

Audit logs - Reports

Migration to version 3 of the firmware deliberately disables the "Top web searches" report. This report is particularly prone to causing the firewall's log service to hang regularly and this instability causes major network traffic disruptions (proxy and security inspections).

The report can however be disabled at the end of the migration process (**Notifications > Report configuration** module).

Support reference 58932 58919

Address translation

To translate the source of traffic sent by the firewall, the destination after translation must not be specified. To do so, delete the *Any* value specified in the **Destination** column in the section **Traffic after translation**.

Support reference 59080

SSL proxy

If the certificate presented by the SSL proxy was signed using SHA-1, the latest version of Google Chrome may issue a security alert preventing it from being used. A workaround to this issue consists of forcing SHA256 to be used. Please refer to the Stormshield knowledge base (under the section *"SNS v3.x current issues"* on the home page of the knowledge base) or get in touch with your [support team](#) for more details on this workaround.

Routing

IPSec interfaces cannot be used for specifying the type of routing in filter rules for IPv6 traffic. This restriction affects interfaces that have been specified directly as well as router objects containing IPSec interfaces.

Filtering

The field corresponding to the name of a filter rule (*rulename*) does not appear in proxy log files.

Hardware

Support reference 58532

SN150 model firewalls

The *Online* LED located on the front panel of the SN150 firewall does not light up when the appliance starts.

Explanations on usage

Network

Spanning Tree protocols (RSTP / MSTP)

Stormshield Network firewalls do not support multi-region MSTP configurations. A firewall implementing an MSTP configuration and interconnecting several MSTP regions may therefore malfunction when managing its own region.

If MSTP has been enabled on a firewall and it is unable to communicate with equipment that does not support this protocol, it would not automatically switch to RSTP.

In order for RSTP and MSTP to function, the interfaces on which they are applied must have an Ethernet layer. As a result:

- MSTP does not support PPTP/PPPoE modems,
- RSTP supports neither VLANs nor PPTP/PPPoE modems.

Interfaces

The firewall's interfaces (VLANs, PPTP interfaces, aggregated interfaces [LACP], etc.) are now grouped together in a common pool for all configuration modules. When an interface previously used in a module is released, it becomes reusable for other modules only after the firewall is rebooted.

Deleting a VLAN interface will change the order of such interfaces the next time the firewall starts. If such interfaces are listed in the dynamic routing configuration or monitored via SNMP MIB-II, this behavior would cause a lag and may potentially cause the service to shut down. You are therefore strongly advised to disable any unused VLAN interfaces instead of deleting them.

On SN150 models, configurations that contain several VLANs included in a bridge will not be supported.

An issue was identified on U30S and SN200 appliances during the creation of several VLANs in a bridge. This issue may potentially cause an error during the transmission of the responses to ARP requests received on these VLANs to other interfaces of the bridge.

Bird dynamic routing

The Bird dynamic routing engine having been upgraded to version 1.6, in configurations implementing BGP with authentication, the "*setkey no*" option must be used. For further information on Bird configuration, please refer to the **Bird Dynamic Routing** Technical Note.

When a Bird configuration file is edited from the web administration interface, the "Apply" action will send this configuration to the firewall. If there are syntax errors, a warning message indicating the row numbers containing errors will inform the user of the need to correct the configuration.

However, if a configuration containing errors is sent to the firewall, it will be applied the next time the Bird service or the firewall is restarted.

IPv6 support

In version 2, the following are the main features that are unavailable for IPv6 traffic:

- IPv6 address translation (NATv6),
- Application inspections (Antivirus, Antispam, HTTP cache, URL filtering, SMTP filtering, FTP filtering and SSL filtering),
- Use of the explicit proxy,
- DNS cache,
- SSL VPN portal tunnels,
- SSL VPN tunnels,
- Radius or Kerberos authentication,
- Vulnerability management,
- Modem interfaces (especially PPPoE modems).

High Availability

In cases where the firewall is in high availability and IPv6 has been enabled on it, the MAC addresses of interfaces using IPv6 (other than those in the HA link) must be defined in the advanced properties. Since IPv6 local link addresses are derived from the MAC address, these addresses will be different, causing routing problems in the event of a switch.

System

Migration

Upgrading to a major firmware release will cause the reinitialization of preferences in the web administration interface (e.g.: customized filters).

Updates to a lower version

Firewalls sold with version 3 firmware are not compatible with older major versions.

Backtracking to a major firmware version older than the firewall's current version would require a prior reset of the firewall to its factory settings (*defaultconfig*). For example, this operation would be necessary in order to migrate a firewall from a 3.0.1 version to a 2.x version.

URL filtering

SN150, SN200, SN300, U30S and U70S models do not allow the use of more than 10 URL filter profiles. On other models, profiles can only be added by editing the URL filter configuration file (ConfigFiles/URLFiltering/slotinfo) in order to add extra sections to it then by creating or downloading the corresponding profiles (11, 12, etc) to the ConfigFiles/URLFiltering folder.

Support reference 3120

Configuration

The NTP client on firewalls only supports synchronization with servers using version 4 of the protocol.

Restoring backups

If a configuration backup has been performed on a firewall whose system version is higher than the current version, it will be impossible to restore this configuration. For example, a configuration backed up in 3.0.0 cannot be restored if the firewall's current version is 2.5.1.

Dynamic objects

Network objects with automatic (dynamic) DNS resolution, for which the DNS server offers round-robin load balancing, cause the configuration of modules to be reloaded only when the current address is no longer found in responses.

DNS (FQDN) name objects

DNS name objects cannot be members of object groups.

Filter rules can only be applied to a single DNS name object. A second FQDN object or any other type of network object cannot be added as such.

DNS name objects can only be used in filter rules.

When a DNS server is not available, the DNS name object will only contain the IPv4 and/or IPv6 address entered when it was created.

If a large number of DNS servers is entered on the firewall, or if new IP addresses relating to DNS name objects are added to the DNS server(s), several requests from the firewall may be required in order to learn all of the IP addresses associated with the object (requests at 5-minute intervals).

If the DNS servers entered on client workstations and on the firewall differ, the IP addresses received for a DNS name object may not be the same. This may cause, for example, anomalies in filtering if the DNS object is used in the filter policy.

Hardware monitoring (watchdog)

SN150 models do not have the hardware monitoring feature (hardware watchdog).

Filter logs

When a filter rule uses load balancing (use of a router object), the destination interface listed in the filter logs may not necessarily be correct. Since filter logs are written as soon as a network packet matches the criteria of a rule, the outgoing interface will not yet be known. As such, the main gateway is systematically reported in filter logs instead.

Quality of service

Network traffic to which Quality of Service (QoS) queues have been applied will not fully benefit from enhancements made to the performance of the "fastpath" mode.

Notifications

IPFIX

Events sent via the IPFIX protocol do not include either the proxy's connections or traffic sent by the firewall itself (e.g.: ESP traffic for the operation of IPSec tunnels).

Activity reports

Reports are generated based on logs recorded by the firewall, which are written when connections end. As a result, connections that are always active (e.g.: IPSec tunnel with translation) will not be displayed in the statistics shown in activity reports.

Whether logs are generated by the firewall depends on the type of traffic, which may not necessarily name objects the same way (*srcname* and *dstname*). In order to prevent multiple

representations of the same object in reports, you are advised to give objects created in the firewall's database the same name as the one given through DNS resolution.

Intrusion prevention

GRE protocol and IPSec tunnels

The decryption of GRE traffic encapsulated in an IPSec tunnel would wrongly generate the alarm "*IP address spoofing on the IPSec interface*". The action *Pass* must therefore be configured for this alarm in order for this type of configuration to function.

HTML scan

Rewritten HTML code is not compatible with all web services (apt-get, Active Update) because the "Content-Length" HTTP header has been deleted.

Instant messaging

NAT is not supported on instant messaging protocols

Support reference 35960

Keep initial routing

The option that allows keeping the initial routing on an interface is not compatible with the features for which the intrusion prevention engine needs to create packets:

- reinitialization of connections when a block alarm is detected (RESET packet sent),
- SYN Proxy protection,
- protocol detection by plugins (filter rules without any protocol specified),
- rewriting of data by certain plugins such as web 2.0, FTP with NAT, SIP with NAT and SMTP protections.

NAT

Support reference 29286

The GRE protocol's state is managed based on source and destination addresses. As such, two simultaneous connections with the same server cannot be distinguished, either from the same client or sharing a common source address (in the case of "map").

H323 support

Support for address translation operations on the H323 protocol is basic, namely because it does not support NAT bypasses by gatekeepers (announcement of an address other than the connection's source or destination).

Proxies

Support reference 35328

FTP proxy

If the "Keep original source IP address" option has been enabled on the FTP proxy, reloading the filter policy would disrupt ongoing FTP transfers (uploads or downloads).

Filtering

Out interface

Filter rules that specify an out interface included in a bridge without being the first interface of such a bridge will not be applied.

Multi-user filtering

Network objects may be allowed to use multi-user authentication (several users authenticated on the same IP address) by entering the object in the list of multi-user objects (Authentication > Authentication policy).

Filter rules with a 'user@object' source (except 'any' or 'unknown@object'), with a protocol other than HTTP, do not apply to this object category. This behavior is inherent in the packet processing mechanism that the intrusion prevention engine runs. The message warning the administrator of this restriction is as follows: "This rule cannot identify a user logged on to a multi-user object."

Geolocation and public IP address reputation

Whenever a filter rule specifies geolocation conditions and public address reputation, both of these conditions must be met in order for the rule to apply.

Host reputation

If IP addresses of hosts are distributed via a DHCP server, the reputation of a host whose address may have been used by another host will be assigned to both hosts. In this case, the host's reputation may be reinitialized using the command `monitor flush hostrep ip = host_ip_address`.

Support reference 31715

URL filtering

Authenticated users cannot be filtered within the same URL filter policy. However, particular filter rules may be applied (application inspection) according to users.

IPSec VPN

Decryption

The IPSec peer distributes data decryption. On multi-processor firewalls, this process is therefore optimized whenever the number of peers is at least equal to the number of the appliance's processors.

PKI

A Certificate Revocation List (CRL) is not required. Even if no CRL is found for the certificate authority (CA), negotiation will be authorized.

Support reference 37332

DPD (Dead Peer Detection)

The VPN feature DPD (Dead Peer Detection) makes it possible to check whether a peer is still up by sending encrypted ISAKMP requests through the ISAKMP SA (Security Association).

If a firewall is the responder in an IPSec negotiation in main mode, and DPD has been set to "inactive", this parameter will be forced to "passive" in order to respond to the peer's DPD queries.

During this IPSec negotiation, DPD will be negotiated even before the peer has been identified, and therefore before even knowing whether DPD queries can be ignored for this peer.

This parameter has not been modified in aggressive mode, as in this case DPD would be negotiated when the peer has already been identified, or when the firewall is the initiator of the negotiation.

Keepalive IPv6

For site-to-site IPSec tunnels, the additional keepalive option that allows artificially keeping these tunnels up cannot be used with traffic endpoints with IPv6 addresses. In cases where traffic endpoints are dual stack (both IPv4 and IPv6 addresses are used), only IPv4 traffic will benefit from this feature.

IPSec VPN IKEv2

Both versions of the IKE protocol (IKEv1 and IKEv2) currently cannot be used simultaneously in the same IPSec policy.

The EAP (Extensible Authentication Protocol) protocol cannot be used for the authentication of IPSec peers using the IKEv2 protocol.

In a configuration that implements an IPSec tunnel based on IKEv2 and address translation, the identifier that the source machine presents to the remote peer in order to set up the tunnel corresponds to its real IP address instead of its translated IP address. You are therefore advised to force the settings of the local identifier to be presented (Local ID field in the definition of an IKEv2 IPSec peer) using the translated address (if it is static) or an FQDN from the source firewall.

A backup configuration cannot be defined for IPSec peers using IKEv2. In order to implement a redundant IKEv2 IPSec configuration, you are advised to use virtual IPSec interfaces and router objects in filter rules (PBR).

Authentication

SSO Agent

The SSO agent authentication method is based on authentication events collected by Windows domain controllers. Since these events do not indicate the source of the traffic, interfaces cannot be specified in the authentication policy.

Support reference 47378

The SSO agent does not support user names containing the following special characters: " <tab> & ~ | = * < > ! [] \ \$ % ? ' ` @ <space>. As such, the firewall will not receive connection and disconnection notifications relating to such users.

Multiple Microsoft Active Directory domains

In the context of multiple Microsoft Active Directory domains linked by an approval relationship, an Active Directory and SSO agent need to be defined in the firewall's configuration for each of these domains.

Radius and Kerberos cannot be used on several Active Directory domains.

The IPSec Phase 1 negotiation is incompatible with multiple Microsoft Active Directories for the authentication of mobile clients.

The IKEv1 protocol requires extended authentication (XAUTH).

**Multiple directories**

Users that have been defined as administrators on the firewall must originate from the default directory.

Mobile IPSec clients can only authenticate on the default directory.

CONNECT method

Multi-user authentication on the same machine in cookie mode does not support the CONNECT method (HTTP). This method is generally used with an explicit proxy for HTTPS connections. For this type of authentication, you are advised to use "transparent" mode. For further information, please refer to our online help at documentation.stormshield.eu, under the chapter "Authentication".

Conditions of use

The Internet access conditions of use may not display correctly on the captive portal in Internet Explorer v9 with the IE Explorer 7 compatibility mode.

Users

The management of multiple LDAP directories requires authentication that specifies the authentication domain: user@domain.

The <space> character is not supported in user logins.

Logging off

Users may only log off from an authentication using the same method used during authentication. For example, a user authenticated with the SSO agent method will not be able to log off via the authentication portal as the user would need to provide a cookie to log off, which does not exist in this case.

High Availability

HA interaction in bridge mode and switches

In a firewall cluster configured in bridge mode, the average duration of a traffic switch was observed to be around 10 seconds. This duration is related to the switchover time of 1 second, in addition to the time that switches connected directly to the firewalls take to learn MAC addresses.

Policy-based routing

A session routed by the filter policy may be lost when a cluster is switched over.

Models

High availability based on a cluster of firewalls of differing models is not supported. Moreover, clusters in which one firewall uses 32-bit firmware and the other uses 64-bit firmware are not allowed.

Vulnerability management

Support reference 28665

The application inventory carried out by the Vulnerability manager is based on the IP address of the machine initiating the traffic in order to index applications.

For machines with an IP address shared among several users, for example an HTTP proxy, a TSE server or a router that dynamically translates the source, may greatly increase the load on the module. You are therefore advised to place the addresses of these machines in an exclusion list (unsupervised elements).

Stormshield Network administration suite

SN Real-Time Monitor

File transfer commands (sending and receiving) from the CLI console in SN Real-Time Monitor no longer function in 2.x and higher versions.

Support reference 28665

The command CLI MONITOR FLUSH SA ALL was initially meant to disable ongoing IPSec tunnels by deleting their SAs (security associations). However, as Bird dynamic routing also uses this type of security association (SA), this command would degrade the Bird configuration, preventing any connections from being set up. This issue also arises with the "Reinitialize all tunnels" function, offered in the Real-Time Monitor interface.

The Bird service must be restarted in order to resolve this issue.

SN Event Reporter

SN Event Reporter is no longer included in the administration suite from version 3 onwards, and connections from SN Event Reporter to firewalls in version 3 and up will not be supported

Documentation

The following technical documentation is available in PDF in the documentation base in the [client area](#). We suggest that you rely on these resources for a better application of all features in this version.

Guides

- Stormshield Network Firewall - User and configuration manual
- Stormshield Network virtual firewalls - Installation guide
- Stormshield Network Global Administration - User and configuration manual
- Stormshield Network Real-Time Monitor - User and configuration manual
- CLI Serverd - Commands reference guide
- CLI Console / SSH - Commands reference guide

Technical notes

- Level 2 encapsulation
- Stacking: distribution of traffic among several firewalls
- LACP link aggregation

Hashes

In order to check the integrity of Stormshield Network Security binary files, enter one of the following commands and compare the result with the hashes indicated in the [MyStormshield](#) client area, under **Downloads > SNS > Firmware** or **Software**:

- Linux operating system: `sha256sum filename`
- Windows operating system: `CertUtil -hashfile filename SHA256`

Replace `filename` with the name of the file you want to check.

Contributions from previous versions of Stormshield Network Security 3

In this section, you will find the new features, resolved vulnerabilities and fixes from previous versions of Stormshield Network Security 3.

3.0.2		Bug fixes
3.0.1	New features	Bug fixes
3.0.0	New features	

Version 3.0.2 bug fixes

This list is not exhaustive and other fixes may have been included in this version.

Intrusion prevention

Support reference 57337

SSL protocol

An issue regarding access to websites using CHACHA20 and Poly1305 encryption suites has been fixed following the upgrade of these suites.

System

Support reference 57350 57356

SSL VPN - IPsec VPN

After a migration to SNS v3, connections via the SSL VPN client or IPsec VPN client could fail to function as the *sslvpn* and *ipsec* interfaces were linked to the *Guest* profile. This issue has been fixed and these interfaces will no longer be associated with any profile after a migration.

Support reference 58536

Authentication

A migration to SNS v3 could cause the *Internal* profile of the captive portal to be associated with an unknown interface ["0" interface]. This anomaly, which would then prevent these associations from being modified (*Captive portal* tab in the **Configuration > Users > Authentication** module), has been fixed.

Support reference 58433

Proxies

Enabling the DNS cache before a proxy cache could cause the proxy to hang when the firewall is restarted.

Support reference 56184

Filtering

It was impossible to add URLs that were accessible without authentication in a filter rule specifying a redirection to the authentication portal. This issue has been fixed.

High availability

Support reference 58530

In a high availability configuration, the synchronization mechanism could wrongly attempt to enable the hardware *bypass* system reserved for industrial firewalls (SNi40 model). This anomaly, which would generate a synchronization error, has been fixed.

Support reference 58367

The upgrade of a firewall cluster to version 3 could fail during the synchronization of the license file with the passive appliance. This issue has been fixed.

Support reference 58113

Extended Web Control

If the synchronous mode of the Extended Web Control URL filtering solution was enabled on a firewall in version SNS v2, this mode will be automatically disabled in favor of asynchronous mode during a migration of the firmware to v3.0.2.

Support reference 58496

Automatic backups

Enabling automatic backups in a configuration using several LDAP directories could fail and disable the LDAP module. This issue has been fixed.

Dashboard

Support reference 56635

LDAP configuration

The dashboard of a firewall that does not have a configured LDAP directory would display a misleading message ("LDAP configuration: Disabled. The directory has been configured but the module has not been enabled"). This anomaly has been fixed and the message "No default directory has been configured or enabled" will now appear.

New features in version 3.0.1

SN150 model firewalls

Version 3.0.1 of the firmware ensures compatibility with SN150 firewalls.

Version 3.0.1 bug fixes

Intrusion prevention

Support reference 56973 57355

IDS / Firewall modes

In a configuration that implements filter rules in IDS or Firewall mode and authentication, invalid ICMP traffic that raises alarms which do not block such traffic (*Pass* action) would cause the firewall to hang. This issue has been fixed.

Support reference 56740

Memory resources

Whenever there is a large number of connections, an anomaly in the management of memory resources would cause the firewall to hang then restart. This anomaly has been fixed.

System

Support reference 56964

IPSec tunnels (IKEv2)

Whenever the email address field of a CA used for signing server certificates was filled in, the firewall would refuse to set up IKEv2 IPSec tunnels for which authentication was based on such certificates. This anomaly has been fixed.

Activity Reports

"Host reputation" report

An error in the application of destination host reputations for SSL connections has been fixed.

New features in version 3.0.0

Unified web interface

The unified web interface now covers the administration, monitoring and reporting of Stormshield Network firewalls.

A new monitoring window offers graphs (in real time and with history statistics) on system resources used (memory and CPU), throughput per interface and connected users as well as detailed information on machines (ongoing connections, applications used, vulnerabilities detected, etc).

Many interactive features facilitate the search for incidents and the administration of Stormshield Network firewalls.

Temporary user management

In order to provide easy Internet access to persons outside the organization or in public places, Stormshield Network products offer advanced features for managing temporary users.

In addition to guest mode, which was already available, version 3 includes "sponsorship" mode and a new portal to create temporary accounts.

The current "guest" portal may be enriched with new fields (first name, last name, e-mail address, etc) that the user will need to enter before accepting the Internet access charter.

Temporary accounts can be created easily thanks to a simplified screen that can only be accessed by persons authorized to create such accounts.

"Sponsorship" mode makes it possible to delegate - to an authorized person - the privilege of accepting or rejecting an Internet access request from a person outside the organization.

Many enhancements allow customizing users' various access portals.

Integration into a multi-domain environment

Users can now be authenticated on several Active Directory domains. It is therefore possible to authenticate users originating from various domains and applying distinct security policies to them.

Multiple directories also offer the possibility of registering firewall administrators in an internal directory and managing unprivileged users in an external directory.

IP geolocation - Country-based filtering

Thanks to the geolocation feature, administrators gain visibility over the source or destination of their network traffic. Security policies can therefore be adapted to filter traffic according to new geographical criteria represented by "Country" or "Continent" objects.

All log files and reports have been enriched with a new item corresponding to the country.

IP Reputation – External host reputation

This feature, which can be combined with geolocation, makes it possible to lower an organization's attack risk.

Public IP addresses with a bad reputation (e.g.: Tor exit nodes) will fall under one of seven categories: Spam, Phishing, Anonymizer, Botnet, Malware, Tor or Scanner. These categories are regularly updated through the Active Update mechanism.

Through his security policy, the administrator can therefore block external machines with bad reputations from attempting to access the organization's network, and prohibit connections from internal workstations to reputedly risky hosts.

Dynamic Host Reputation – Internal host reputation

Security policies can now be assigned based on the reputation of internal hosts.

Reputations, represented by a score, can be calculated dynamically thanks to ratings provided by the inspection engines built into Stormshield firewalls. Whenever our sandboxing solution detects a virus, raises a major alarm or identifies malware, the host's score will automatically be raised.

Administrators can view the history of a host's reputation score in the new "monitoring" module. Other indicators such as the average score of a network and the maximum score, provide additional information to help them define their security policies and act on hosts that require intervention.

"DNS names (FQDN)" objects

In order to refine a security policy, it is now possible to use network objects defined only by their FQDN (IP address(es) automatically retrieved by DNS resolutions) such as "google.com" or "office365.com".

Safe transmission of Syslog traffic through the TLS protocol

The transmission of logs to one or several Syslog servers (maximum 4) via TCP can now be secured through the TLS protocol with client and server certificate authentication.

This secure transmission of Syslog traffic is compatible with the Stormshield Visibility Center solution.

Stormshield Network firewalls support several standardized formats of Syslog messages (RFC3164, RFC5424, RFC5425 and RFC6587).

Possibility of configuring the hash algorithm in the internal PKI and the SSL proxy

The Certificates and PKI module offers the possibility of selecting the hash algorithm (in particular SHA256) used for the certificates of the SSL proxy and the firewall's internal PKI.

IPFIX/Netflow support

Compatibility with Netflow/IPfix collectors allows administrators to easily identify potential network issues.

Customized signatures on the intrusion prevention (IPS) engine

Administrators can now create their own context-based signatures in order to detect applications inside the organization.

SNi40 - Hardware bypass

In order to ensure service continuity in an industrial setting, the SNi40 firewall is equipped with a hardware bypass function, which when enabled, allows network traffic to pass through in the event of a power outage or appliance breakdown.

Importing and exporting the contents of the network objects database

Exporting the objects database in CSV format makes it possible to save the database and reimport it directly into the Stormshield Management Center centralized administration solution.

The structure of the rows that make up the objects database in CSV format is available in **Appendix B** of the **Stormshield Network Configuration and Administration Manual**.

Official support for KVM and Hyper-V virtualization platforms

Stormshield Network virtual firewalls are available for Microsoft Hyper-V (VHD format) and KVM platforms (Kernel-based Virtual Machine - QCOW2 format). The supported versions of hypervisors are listed in the [Compatibility](#) chapter of this document.

Intrusion prevention scans on HTTP traffic with on-the-fly decompression

The intrusion prevention engine is now capable of decompressing HTTP data on the fly in order to perform IPS scans on this protocol. The firewall therefore no longer needs to modify the headers of HTTP packets sent by the client in order to mask compression support (*accept-encoding*). As a result, this mechanism reduces latency and the amount of data needed for transferring HTTP packets, but demands a greater amount of the firewall's resources.

This feature is enabled by default and can be suspended in the HTTP configuration module.

Possibility of adding a constraint on the *Domain name* of the certificate presented by an IPSec peer.

When a certificate authority (CA) is specified in the list of trusted authorities for the establishment of IPSec tunnels, a constraint can be added on the Domain Name (DN) of the certificate presented by the peer in order to strengthen security.

CRL verification and support for *BindAddr* in the firewall's LDAP requests

In the firewall's LDAP configuration, the BindAddr parameter followed by the firewall's private IP address forces the firewall to present this IP address during LDAP requests to an external directory: LDAP traffic can therefore be encapsulated in an IPSec tunnel in order to encrypt requests to the directory.

This parameter can only be modified in command line (setconf ConfigFiles/ldap *LDAP_Name BindAddr FW_Private_IP*).

IPS scans of the Ethernet/IP industrial protocol

The intrusion prevention engine now allows filtering (*Analyze / Block*) public command sets for this protocol. A customized list of Ethernet/IP commands that need to be allowed can also be specified.

Intrusion prevention scans for SNMP

SNMP (Simple Network Management Protocol) is a network equipment monitoring protocol. The IPS scan for this protocol has been particularly enriched. It is therefore now possible to allow or block SNMP packets according to the version of the protocol (SNMPv1, v2c or v3), create community whitelists/blacklists (SNMPv1 and v2c), identifiers (SNMPv3) or OIDs (*Object Identifier*).

NAT support for Dynamic DNS

The module that sends the public IP address to the dynamic DNS registration service provider now distinguishes the real public IP address presented by a NAT router from the local address. This feature can be enabled by selecting Support address translation (NAT) in the advanced properties of the Dynamic DNS module.

SSL proxy - Support for new encryption algorithms

The SSL proxy supports new encryption algorithms based on elliptic curves (ECDSA algorithm: Elliptic Curve Digital Signature Algorithm).

Systematic verification of unused objects

The **Network objects** module displays the list of objects found in the firewall's database; objects are classified by category (hosts, networks, DNS domain names [FQDN], etc).

A colored symbol appears before each object, dynamically indicating whether the object is being used in the firewall's configuration (green chip) or not (gray chip). Clicking on the "eye" icon located to the right of a green chip will list all the modules using the object in question.

Rule names in IPS logs and active connection logs

The Filter and NAT module makes it possible to assign a name to each rule created. Do note that the "Name" column is hidden by default.

This rule name (*rulename*) is referenced in IPS logs and connection logs. It has the advantage of not changing according to rule criteria (via, interface, etc) or the position of a rule in a filter policy, unlike rule identifiers (*ruleid*). As such, filter or NAT rules can be easily handled according to their names.

Exporting monitoring data and audit logs

In the same way as report data, the information displayed in audit logs and the data presented in the tables of the monitoring module can also be exported to a file in CSV format.

Sandboxing – Form to report false positives

The interactions offered on audit logs allow warning Stormshield of any wrong categorization following a sandboxing operation. This feature therefore makes it possible to unblock attachments that have been wrongly considered malicious.

Authentication

The maximum length of an identifier has been raised to 255 characters. Moreover, users can now be included in 250 groups (this limit used to be 50 in older versions).

SSL VPN

The SSL VPN Client configuration file now includes register-dns and block-outside-dns options indicating, respectively, for the client to write the DNS server(s) specified by the Stormshield Network firewall to its configuration, and to not use third-party DNS servers. This feature shortens the time needed for receiving responses to the client's DNS requests, especially for machines running in Microsoft Windows 10.

Child connections (active FTP) through virtual IPsec interfaces

Traffic that creates child connections (e.g.: active FTP) is now compatible with the use of virtual IPsec interfaces (VTI).

TCP-based DNS requests

Stormshield Network firewalls automatically switch their DNS requests over to TCP whenever they receive a response exceeding 512 bytes (response with many entries such as dynamic objects and DNS name objects [FQDN]).

Addition of logs in stateful pseudo-connections

Stateful pseudo-connections (GRE, ESP, etc) now generate registrations in connection log files (*/connection*) and filter statistics files (*/filterstat*).

Support for generic 3G/4G modems

For generic 3G/4G modems whose characteristics are not automatically recognized, up to two profiles grouping configuration information (model, vendor ID, etc) can be defined, such information having to be manually entered. The various fields to configure are explained in the chapter **Creating a modem** in the **Stormshield Network Configuration and Administration Manual**.

Strengthening the IPS scan on TCP

The TCP IPS scan has been strengthened in order to detect data in RESET packets and setting off the specific alarm "TCP RST with data". It can now also handle a larger amount of unacknowledged data without setting off alarm no. 84 "TCP data queue overflow".

Other features

- Improvement of the intrusion prevention scan on the SSL protocol with regard to fragmented headers
- Support for Unicode international characters in certificates
- Inclusion of source and destination object names in alarm e-mails
- Addition of the firewall's system name in Shell command prompts

Contact

To contact our Technical Assistance Center (TAC) Stormshield:

- <https://mystormshield.eu/>

All requests to technical support must be submitted through the incident manager in the private-access area https://mystormshield.eu, under **Technical support** > **Report an incident** / **Follow up on an incident**.

- +33 (0) 9 69 329 129

In order for us to provide high-quality service, you are advised to use this communication method only to follow up on incidents that have been created earlier on https://mystormshield.eu.
